

Table: T

Col1	Col2	Col3	Col4	id
a	0	a	1	id ₁
b	2	d	1	id ₂
c	5	p	5	id ₃
d	8	d	8	id ₄
e	3	e	2	id ₅
f	4	e	4	id ₆

R can be considered as a **set** of **tuples/facts** in the **Table/Relation**.

Q(T): A query on T.

A query is a logical expression.

It can output a **set** or a **value**.

If $Q: T \rightarrow T'$, where $T' \subseteq T$ - This means Q is a set of criteria that chooses a subset of T.

If $Q: T \rightarrow \mathbb{R}$ (Or can be Boolean) - This means Q is a function on T.

Q: Return the tuples where the value in **col2** is greater than the value in **col4**
